

MUJIE 慕杰®

YOUR AUTOMATION, YOUR MUJIE!

钟表齿轮式多圈绝对值SSI输出系列

Clock gear type multi turn absolute value SSI output series

可承受较高的轴向和径向负荷
可在任意位置设置新的原点，
高防护等级外壳IP67,完全防水防油
应用于测量、自动控制、机器人、印刷包装及数控等

Can withstand high axial and radial load
New the origin can be installed in any position
High degree of protection shell IP67, completely waterproof and oil
Application in the measurement, automatic control, robotics, printing and packaging and CNC, etc

▶ 原点设置方法 Origin setting method

为避免可能的累积误差，以及安装时寻找原点的麻烦，在编码器内部嵌入了原点设置程序，在外部预留了原点设置线，用户可方便快捷的设置原点。
(Modbus RTU、RS485、SSI三种输出类型的原点设置方法一样)

In order to avoid possible accumulated errors and the trouble of finding the origin during installation, an origin setting program is embedded in the encoder, and an origin setting line is reserved outside, so that the user can easily and quickly set the origin. (the origin setting method of Modbus RTU, RS485 and SSI output types is the same)

1. 通电状态下，把设置原点的芯线(橙色线)接到编码器电源正极(棕色线) 3 秒后断开，当前位置设为新的原点，并能掉电保存。
1. In the power on state, connect the core wire (orange wire) that sets the origin to the positive electrode (brown wire) of the encoder power supply and disconnect it for 3 seconds. The current position is set to the new origin and can be saved after power off.
2. 如果把设置原点的芯线(橙色线)一直在编码器的电源正极，那么编码器将只设置一次原点。
2. If the core wire (orange wire) for setting the origin is always connected to the positive pole of the power supply of the encoder, the encoder will only set the origin once.
3. 设置完原点之后把芯线(橙色线)接蓝色线或者棕色线，不要悬空。
3. After setting the origin, connect the core wire (orange wire) to the blue wire or brown wire, and do not hang in the air.

※注：保持时间 3 秒，为出厂设置，用户不可自行修改，可根据用户要求更改这个时间。

※ note: the holding time is 3 seconds, which is the factory setting and cannot be modified by the user. The time can be changed according to the user's requirements.

※注：出厂默认原点设置操作后，编码器单圈数据为0，圈数数据为圈数中间值。

※ note: after the factory default origin setting operation, the encoder single turn data is 0, and the number of turns data is the middle value of the number of turns.

也可以根据要求让编码器原点设备操作后，编码器单圈数据为0，圈数数据为0，例如256圈，原点操作后圈数值变成0。

You can also operate the encoder origin device according to the requirements. After the operation of the encoder origin device, the data of a single turn of the encoder is 0, and the data of the number of turns is 0. The column is 256 turns. After the operation of the origin device, the number of turns becomes 0.

※也可以软件重置原点，通讯指令详见后页。

※ you can also reset the origin by software. See the following page for communication instructions.

▶ MJ485自定义协议模式 (即主动发送模式) Mj485 custom protocol mode (i.e. active transmission mode)

数据帧格式 Data frame format		数据位 Data bit				和校验 Sum verification	异或校验 Exclusive or check	帧尾End of frame
帧头 Frame header	数据长度 Data length:	0X00	0X00	0X1F	0X23	校验码 Check code	校验码 Check code	0X3D
0XAB	0XCD	0X05	0X00	0X00	0X00	0X00	0X00	0X00
				单圈 高八位 Single lap High octave	单圈 低八位 Single lap Lower octave			

※注：数据格式1个起始位，8个数据位，1个停止位，无奇偶校验位。※ note: Data Format: 1 start bit, 8 data bits, 1 stop bit, no parity bit.

和校验 = 0X05 + 0X00 + 0X00，单圈高八位 + 单圈低八位 Sum check = 0x05 + 0x00 + 0x00 + single loop high eight bits + single loop low eight bits

异或校验 = 0X05 ^ 0X00 ^ 0X00，单圈高八位 ^ 单圈低八位 Exclusive or check = 0x05 ^ 0x00 ^ 0x00 ^ single loop high eight bits ^ single loop low eight bits

修改参数 Modify parameters		参数 Parameter					帧尾End of frame
帧头 Frame header	帧字节 长度 Frame byte length	分辨率 resolving power	递增方向 Increasing direction	波特率 Baud rate	协议模式 Protocol mode	0X3D	
0XAB	0XCD	0X08					
单圈分辨率 Single circle resolution	0X00	14Bit $2^{14} = 16384$	递增方向 Baud rate	0X01	4800	0X3D	
	0X01	13Bit $2^{13} = 8192$		0X02	9600		
	0X02	12Bit $2^{12} = 4096$ (出厂默认) (factory default)		0X03	19200 (出厂默认) (factory default)		
	0X03	11Bit $2^{11} = 2048$		0X04	38400		
	0X04	10Bit $2^{10} = 1024$		0X05	11520		
	0X05	9Bit $2^9 = 512$		协议模式 Protocol mode	0X01		自定义主动发送 (出厂默认) Custom active sending (factory default)
0X06	8Bit $2^8 = 256$	0X02	MODBUS RTU				
递增方向 Increasing direction	0X01	逆时针旋转递增 (从轴的方向看过去) Counterclockwise rotation increment (viewed from the direction of the shaft)					
0X02	顺时针旋转递增 (出厂默认) Clockwise rotation increment (factory default)						

※注：修改参数的步骤 ※ note: steps for modifying parameters

1. 把黄色线接到编码器正极，编码器停止主动发送数据，等待接收配置参数。

1. Connect the yellow line to the positive electrode of the encoder. The encoder stops actively sending data and waits for receiving configuration parameters.

2. 通过串口向编码器发送 2. Send to encoder through serial port

例如 for example :0XAB 0XCD 0X08 0X02 0X02 0X03 0X02 0X3D

编码器应答 Encoder response: 0X02 0X02 0X03 0X02

表明配置成功，进入Modbus RTU模式。 Indicates that the configuration is successful and enters Modbus RTU mode.

恢复默认参数 Restore default parameters	
在通电状态下，把 (橙色线和黄色线) 同时接到编码器正极 (棕色线)，保持5秒，然后断开。 In the energized state, connect (orange line and yellow line) to the positive electrode (brown line) of the encoder at the same time, keep it for 5 seconds, and then disconnect it.	
波特率 Baud rate	19200
分辨率 Resolving power	$2^{12} = 4096$
旋转方向 Rotation direction	从轴向看顺时针数值增加 From the axial direction, the clockwise value increases

▶ Modbus RTU 协议 (即被动发送模式)

Modbus RTU 协议模式下读取编码器数据 功能码 04H或03H Read encoder data function code 04H or 03h in Modbus RTU protocol mode

示例:以单圈4096分辨率为例。编码器当前位置在1579，十六进制连个字节表示为062B。 Example take the 4096 resolution of single circle as an example. The current position of the encoder is 1579, and hexadecimal consecutive bytes are represented as 062B.

主机发送指令 Host sends instructions	01	04	0000	0002	71 CB
	站号地址 Station number and address	功能码 Function code	起始地址0X0000 Starting address: 0x0000	读两个16Bit寄存器 Read two 16bit registers	校验码 Check code
编码器应答 Encoder response	01	04	04	00 00 06 28	B83B
	站号地址 Station number and address	功能码 Function code	四个字节 Four bytes	编码器当前位置数据 Encoder current position data	校验码 Check code

增量信号电气规格参数 Incremental signal electrical specifications

型号 Model	T3U	T6Z	LS6U
电源电压 Supply voltage	1-30V±5%或者5-12VDC±5%	5VDC ±5%	10-30v±5%
输出类型 Type of output	全兼容型推拉输出 Fully compatible push-pull output	Rs422类型 Rs422 type	RS422类型兼容TTL HTL Rs422 type compatible with TTL and HTL
输出幅值 Output amplitude	波形幅值为略低于电源电压 The amplitude of the waveform is slightly lower than that of the power supply	波形幅值为5V Waveform amplitude is 5V	波形幅值为略低于电源 The waveform amplitude is slightly lower than the power supply
输出形式 Output form:	推拉输出 Push pull output	线性驱动输出 Linear drive output	加强型线性驱动输出 Enhanced linear drive output
输出容量 Output capacity	High: 负载电流2mA以下输出电压:3.5V以上Low:负载电流2mA以下残留电压:0.5V以下 High: load current below 2mA output voltage: above 3.5V low: load current below 2mA residual voltage: below 0.5V		
分辨率 Resolving power	360、600、1000、1024、2048、2000、2500		
输出相数 Number of output phases	3相ABZ方波 square wave	6相A B Z \bar{A} \bar{B} \bar{Z} 方波square wave	6相A B Z \bar{A} \bar{B} \bar{Z} 方波square wave
输出相位差 Output phase difference	Ab之间相位差 Phase difference between :1/4T±1/8T (即9±45)		
Z相信号宽度 Z-phase signal width	T±1/8T (即 Namely 360+45)或者 perhaps 1/2T, 1/4T		
上升时间/下降时间 Rising time / falling time	≤0.2us	≤0.2us	≤0.2us
最大响应频率 Maximum response frequency	300KHz	300KHz	300KHz
允许最大转速 Allowable maximum speed	16800rpm分辨率1000时数据, 分辨率更低 Data with 16800rpm resolution of 1000, lower resolution		

SSI 时序图 SSI sequence diagram

举例说明: 圈数12位, 单圈13位, 共计25位数据, 上位机如PLC, 控制板等, 需给出25+1=26个时钟信号

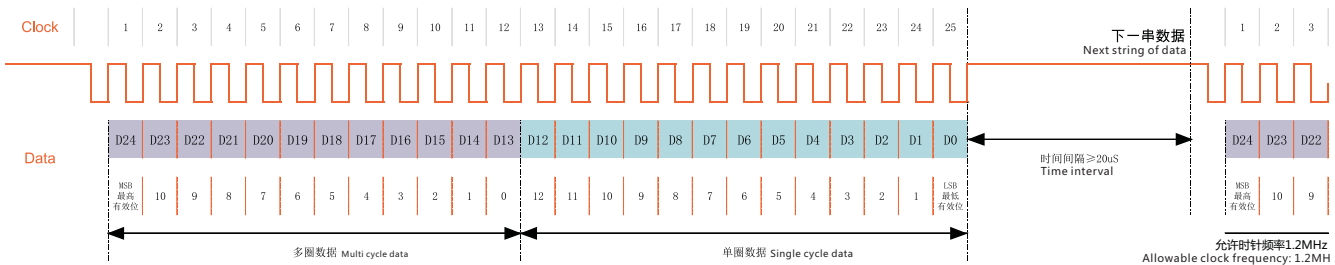

For example: the number of turns is 12 bits, the number of single turn is 13 bits, and the total data is 25 bits. The upper computer such as PLC and control board need to give 25 + 1 = 26 clock signals

圈数12位, 单圈12位, 共计24位数据, 上位机如PLC, 控制板等, 需给出24+1=25个时钟信号

The number of turns is 12 bits, the number of single turn is 12 bits, and the total data is 24 bits. The upper computer, such as PLC and control board, needs to give 24 + 1 = 25 clock signals

上位机给出的时钟频率最大支持1.2MHz, 每次数据间隔的时间必须大大于20us

The clock frequency given by the upper computer can support 1.2MHz at most, and the time of each data interval must be greater than 20us

SSI输出旋转方向设置方法 SSI output rotation direction setting method

编码器的(黄色线)接编码器正极(棕色线)

Encoder (yellow line) is connected to encoder positive electrode (brown line)

编码器的(黄色线)接编码器负极(蓝色线)

Encoder (yellow line) is connected to encoder negative electrode (blue line)

从编码器轴方向看过去, 顺时针方向数值增加

When viewed from the encoder shaft, the value increases clockwise

从编码器轴方向看过去, 顺时针方向数值减小

When viewed from the encoder shaft, the value decreases clockwise

原点设置方法 origin setting method

为避免可能的累积误差, 以及安装时寻找原点的麻烦, 在编码器内部嵌入了原点设置程序, 在外部预留了原点设置线, 用

In order to avoid possible accumulated errors and trouble of finding the origin during installation, an origin setting program is embedded in the encoder, and an origin setting line is reserved outside, using the user can easily and quickly set the origin (the origin setting methods of the three output types of Modbus RTU, RS485 and SSI are the same)

户外可方便快捷的设置原点(Modbus RTU、RS485、SSI三种输出类型的原点设置方法一样)

1. 通电状态下, 把设置原点的芯线(橙色线)接到编码器电源正极(棕色线)3秒后断开, 当前位置设为新的原点, 并能掉电保存

1. In the powered on state, connect the core wire (orange wire) with the origin set to the positive pole (brown wire) of the encoder power supply for 3 seconds and then disconnect it. The current position is set to the new origin and can be saved after power down

2. 如果把设置原点的芯线(橙色线)一直接在编码器的电源正极, 那么编码器将只设置一次原点

2. If the core wire (orange wire) for setting the origin is always connected to the positive power supply of the encoder, then the encoder will only set the origin once

3. 设置完原点之后把芯线(橙色线)接蓝色线或者接地

3. After setting the origin, connect the core wire (orange wire) to the blue wire or ground

※注: 数据原点设置线(橙色线)和电源正极(棕色线)保持时间3秒, 为出厂设置, 用户不可自行修改, 可根据用户要求更改这个时间

※note: the straight line (Orange line) and the positive line (brown line) of the power supply are set at the data origin for 3 seconds, which are factory settings and cannot be modified by the user, but can be changed according to the user's requirements

※注: 出厂默认原点设置操作后, 编码器单圈数据为,

※note: after the factory default origin setting operation, the encoder single turn data is,

圈数数据头也可以根据要求让编码器原点设置操作后, 编码器单圈数据位, 圈数数据为中间值, 例如256圈, 原点操作后圈数变成128.

The number of turns data head can also let the encoder set the data bits of a single turn of the encoder according to requirements. The number of turns data is the middle value, for example, 256 turns. After the operation of the origin, the number of turns becomes 128.

这样做的目的是让编码器正反转尽量在总圈数量程范围内

The purpose of this is to make the forward and reverse rotation of the encoder within the range of the total number of turns as far as possible

电气连接图 Electrical connection diagram

仅绝对值信号SSI输出接线图 Only absolute value signal (SSI) output wiring diagram

SSI绝对信号接线 SSI absolute signal wiring

- 白色 White :Data +
- 灰色 Grey:Data-
- 黑色 Black:Clock+
- 红色 Red:Clock-
- 橙色 Orange:原点设置线
- 黄色 Yellow:方向设置
- 棕色 Brown:+V
- 蓝色 Blue:0V
- 黑粗线:屏蔽线 Black thick wire: shielded wire

- ※橙色线出厂默认为圈数中点设置线,
- ※the orange line is set at the midpoint of the number of turns by default,
- 也可以根据要求改为圈数任意点设置线
- You can also set the line at any point according to the number of turns as required
- 更改的主要目的是尽量保证编码器在圈数量程范围内。
- The main purpose of the change is to ensure that the encoder is within the range of the number of turns as far as possible.
- ※为使信号更稳定, 屏蔽线请良好接地
- ※In order to make the signal more stable, the shielded wire should be well grounded
- ※不使用的配线请做绝缘处理, 避免线末端相互触碰
- ※The unused wiring should be insulated to avoid touching the ends of the wires
